## BENZYLIDENE-THIAZOLIDINEDIONES AND ANALOGUES AND THEIR USE IN THE TREATMENT OF DIABETES

This application claims priority to the U.S. provisional application Serial Number 60/151,670, filed August 31, 1999, the disclosure of which application is hereby incorporated in its entirety by this reference.

### Background of the Invention

Type 2 diabetes, also referred to as non-insulin dependent diabetes mellitus (NIDDM), afflicts between 80 and 90% of all diabetic patients in developed countries. In the United States alone, approximately 15 million people, and more than 100 million worldwide, are affected. Because this disorder is a late onset disease and occurs often in overweight persons it can be expected that the number of patients suffering from this disease will increase further. Patients suffering from type 2 diabetes usually still produce insulin but become increasingly resistant to their own insulin and to insulin therapy. A promising new class of drugs has been recently introduced that resensitizes patients to their own insulin (insulin sensitizers), thereby reducing blood glucose and triglyceride levels, and thus abolishing, or at least reducing, the requirement for exogenous insulin. Troglitazone (Resulin™) and rosiglitazone (Avandia™) belong to the thiazolidinediones (TZD) class of chemicals, and are the first representatives of this class of chemicals approved for the treatment of type 2 diabetes in the United States and several other countries. These compounds, however, have side effects including rare but severe liver toxicities (i.e., troglitazone) and they can increase body weight in humans. Such side effects are of major concern for patients who might require treatment for a decade or longer. Therefore, new and better drugs for the treatment of type 2 diabetes and related disorders are needed. New heterocyclic derivatives that are

useful, for example, to modulate metabolism (such as, for example, lipid metabolism and carbohydrate metabolism) or adipocyte differentiation, and especially to treat type 2 diabetes and other diseases are disclosed.

In still another embodiment of the invention wherein the A group is present (i.e. n is 1), R<sub>1</sub> and R<sub>2</sub> together with the aromatic ring form a cycloalkyl or substituted cycloalkyl optionally comprising 1 or 2 nitrogen heteroatoms; R<sub>3</sub> is halogen, alkyl, substituted alkyl, haloalkyl, alkoxy, substituted alkoxy, haloalkoxy, amino, mono-substituted amino or di-substituted amino; R<sub>6</sub> and R<sub>7</sub> together form a cycloalkyl optionally comprising 1 or 2 oxygen heteroatoms, and W, X, Y and Z are independently or together -C(O)-, -C(S)-, -S- or -NH- to form a 2,4-thiazolidinedione, 2-thioxo-4-thiazolidinedione, 2-thioxo-4-imidazolidinedione or 2,4-imidazolidinedione residue.

This invention also relates to a pharmaceutical formulation comprising one or more compounds disclosed herein in an admixture with a pharmaceutically acceptable excipient.

Compounds disclosed herein may exist in various tautomeric forms. For example, 2,4-thiazolidinedione-containing compounds disclosed herein may exist in the form of tautomers (Xa), (Xb) and (Xc).

5 It is understood by those of skill in the art that tautomers may also exist with 2-thioxo-4-thiazolidinedione, 2,4-imidazolidinedione, 2-thioxo-4-imidazolidinedione and isoxazolidinedione containing compounds disclosed herein. For convenience, all of the tautomers may be presented herein by a single formula, but it is understood that all tautomers are within the scope of the invention.

10 When - - - - is present both *E* and *Z* configurations are within the scope of the invention. For example, 2,4-thiazolidinedione and 2-thioxo-4-thiazolidinedione of Formula (I) may have the following structures respectively:

The compounds disclosed herein may also include salts of the compounds, such as salts with cations. Cations with which the compounds of the invention may form pharmaceutically acceptable salts include alkali metals, such as sodium or potassium; alkaline earth metals, such as calcium; and trivalent metals, such as aluminum. The only constraint with respect to the selection of the cation is that it should not unacceptably increase the toxicity. Due to the tautomerism described above for the compounds, mono-, di- or tri-salts may be possible depending on the corresponding alkali metal. Also, one or more compounds disclosed herein may include salts formed by reaction of a nitrogen contained within the compound, such as an amine, aniline, substituted aniline, pyridyl and the like, with an acid, such as HCl, carboxylic acid and the like. Therefore, all possible salt forms in relationship to the tautomers and a salt formed from the reaction between a nitrogen and acid are within the scope of the invention.

The present invention provides, but is not limited to, the specific compounds set forth in the Examples as well as those set forth below, and a pharmaceutically acceptable salt thereof:

## 5 Making the Compositions

Various synthetic methods may be employed in the production of the compounds disclosed herein. A representative set of synthetic pathways are shown in Figure 5 for  $n = 0$ . One method, for example, includes coupling a boronic acid of Formula (XX),  $R_{14} = H$ , with a carbonyl-containing aryl bromide of Formula (XXI),  $R_{15} = Br$ , to give biaryl (XXIV) that is substituted with a carbonyl group, preferably a formyl group (i.e.,  $R_5 = H$ ). Alternatively, boronic acid (XX) may be coupled with aryl bromide (XXV),  $R_{15} = Br$ , to give biaryl (XXVI) that is subsequently formylated using techniques known in the art, such as the Vilsmeier or the Vilsmeier-Haack reaction, the Gatterman reaction, the Duff reaction, the Reimer-Tiemann reaction or a like reaction.

Coupling reactions such as that described for the formation of Biaryl (XXIV) and (XXVI) may also be conducted using boronic esters, such as where  $R_{14}$  together with the boron from a pinacol borate ester (formation of pinacol esters: Ishiyama, T., et al., *J. Org. Chem.* 1995, 60, 7508-7510, Ishiyama, T., et al., *Tetrahedron Letters* 1997, 38, 3447-3450; coupling pinacol esters: Firooznia, F. et al., *Tetrahedron Letters* 1999, 40, 213-216, Manickam, G. et al., *Synthesis* 2000, 442-446; all four citations incorporated herein by reference). In addition,  $R_{15}$  may also be I, Cl or triflate (derived from a phenol).

Biaryl (XXVI) may also be acylated, for example by the Friedel-Crafts Acylation reaction or the like. Preferably, biaryl (XXVI) is formylated. Alternatively, in a two step manner, biaryl (XXVI) is formylated by first performing a halogenation step to give biaryl (XXVII), such as a bromination, followed by a halogen-metal exchange reaction using an alkyl lithium and reaction with DMF or equivalent known in the art to give biaryl (XXIV) where  $R_5$  is H. The carbonyl group of biaryl (XXIV) may subsequently be condensed with a heterocycle possessing an active methylene moiety, such as 2,4-thiazolidinedione, 2-thioxo-4-thiazolidinedione, isoxazolidinedione, 2,4-imidazolidinedione or 2-thioxo-4-imidazolidinedione to give benzylidene (XXVIII). The carbonyl group of biaryl (XXIV) may also be reduced,

5 such as with sodium borohydride, to benzyl alcohol (XXIX,  $R_{20} = \text{OH}$ ) and converted to benzyl bromide (XXIX,  $R_{20} = \text{Br}$ ) with HBr or some other method known in the art, such as  $\text{PPh}_3/\text{CBr}_4$ . Benzyl bromide (XXIX,  $R_{20} = \text{Br}$ ) is allowed to react with the anion(s) of 2,4-thiazolidinedione to give biaryl [(XXX), where:  $\text{W} = -\text{C}(\text{O})-$ ,  $\text{X} = -\text{NH}-$ ,  $\text{Y} = -\text{C}(\text{O})-$  and  $\text{Z} = -\text{S}-$ ]. Similarly, anions of other heterocycles disclosed herein may  
 10 be used. Alternative, biaryl [(XXX), where:  $\text{W} = -\text{C}(\text{O})-$ ,  $\text{X} = -\text{NH}-$ ,  $\text{Y} = -\text{C}(\text{O})-$  and  $\text{Z} = -\text{S}-$ ] may be prepared by a reduction of benzylidene [(XXVIII), where:  $\text{W} = -\text{C}(\text{O})-$ ,  $\text{X} = -\text{NH}-$ ,  $\text{Y} = -\text{C}(\text{O})-$  and  $\text{Z} = -\text{S}-$ ] using methods known in the art, such as hydrogenation in the presence of Pd/C, Mg/MeOH and the like.

In an alternative manner, the coupling may take place between aryl (XXII), such  
 15 as where  $R_{15} = \text{Br}$ , and boronic acid (XXIII,  $R_{14} = \text{H}$ ) to give the above mention biaryl (XXIV). Also aryl (XXII) may be coupled with boronic acid (XXXI) to give biaryl (XXVI). Employing the same strategy as described above biaryl (XXVI) may be either formylated or acylated to achieve biaryl (XXIV).

5           A number of methods suitable for reducing benzylidene compounds to benzyl compounds (including hydrogenation, reaction with metal hydride reagents, or dissolving metal reductions) are known to those of skill in the art, and those methods may be applied in the methods of the instant invention.

          The various organic group transformations utilized herein may be performed by  
10 a number of procedures other than those described above. References for other synthetic procedures that may be utilized for the synthetic steps leading to the compounds disclosed herein may be found in, for example, March, J., *Advanced Organic Chemistry, 4<sup>th</sup> Edition*, Wiley-Interscience (1992); or Larock, R. C., *Comprehensive Organic Transformations, A Guide to Functional Group Preparations*,

          One embodiment of the invention relates to the processes for making compounds of Formula I, where n is 0, which comprises coupling two aromatic rings to give a biaryl wherein one of the aryl rings contains a carbonyl moiety, preferably an aldehyde. The resulting biaryl product may be subsequently condensed with an active  
20 methylene compound, such as 2,4-thiazolidinedione, 2-thioxo-4-thiazolidinedione, 2,4-imidazolidinedione or 2-thioxo-4-imidazolidinedione to give a benzylidene compound of Formula (I) where - - - - is a bond. In an optional step, the benzylidene compound may be reduced to give a benzyl compound of Formula (I) where - - - - is absent.

          Coupling of two aryl rings may be conducted using an aryl boronic acid or  
25 esters with an aryl halide (such as, iodo, bromo, or chloro), triflate or diazonium tetrafluoroborate; as described respectively in Suzuki, *Pure & Applied Chem.*, 66:213-222 (1994), Miyaura and Suzuki, *Chem. Rev.* 95:2457-2483 (1995), Watanabe, Miyaura and Suzuki, *Synlett.* 207-210 (1992), Littke and Fu, *Angew. Chem. Int. Ed.*, 37:3387-3388 (1998), Indolese, *Tetrahedron Letters*, 38:3513-3516 (1997), Firooznia, et. al., *Tetrahedron Letters* 40:213-216 (1999), and Darses, et. al., *Bull. Soc. Chim. Fr.* 133:1095-1102 (1996); all incorporated herein by reference. According to this  
30 coupling reaction, precursors such as (XX) and (XXI) may be employed:

70

(XX)

(XXI)

5

where  $R_{14}$  is either alkyl or hydrogen and  $R_{15}$  is a halide (such as, iodo, bromo, or chloro), triflate or diazonium tetrafluoroborate. Alternately, it is understood that the coupling groups may be reversed, such as the use of (XXII) and (XXIII), to achieve the same coupling product:

(XXII)

(XXIII)

10

where  $R_{14}$  and  $R_{15}$  have the same meaning as described above. The preparation of the above mentioned precursors may be prepared by methods readily available to those skilled in the art. For example, the boronic ester may be prepared from an aryl halide by conversion into the corresponding aryl lithium, followed by treatment with a trialkyl borate. Preferably, the boronic ester is hydrolyzed to the boronic acid.

15

The coupling reaction may also be conducted between an arylzinc halide and an aryl halide or triflate. Alternately, the coupling reaction may also be executed using an aryl trialkyltin derivative and an aryl halide or triflate. These coupling methods are reviewed by Stanforth, *Tetrahedron* 54:263-303 (1998) and incorporated herein by reference. In general, the utilization of a specific coupling procedure is selected with

20

5 respect to available precursors, chemoselectivity, regioselectivity and steric considerations.

Condensation of the biaryl carbonyl containing derivatives (e.g., Figure 5, compound (XXIV)) with a suitable active methylene compound, such as, 2,4-thiazolidinedione, may be accomplished by the use of methods known in the art. For  
10 example, the biaryl carbonyl product from the coupling reaction may be condensed with an active methylene compound to give a benzylidene compound of Formula (I) (i.e., - - - - is a bond) as described by Tietze and Beifuss, *Comprehensive Organic Synthesis* (Pergamon Press), 2:341-394, (1991), incorporated herein by reference. It is understood by those of skill in the art that intermediates having hydroxyl groups bound  
15 thereto may be formed during condensation of a biaryl carbonyl containing derivative and an active methylene compound, as shown below.

The hydroxyl groups of such intermediates are often eliminated (as water) during the condensation reaction, to form the desired benzylidene compound. Nevertheless, the conditions of the reaction may be modified for the isolation or further  
20 use of hydroxyl containing intermediates, and such embodiments are within the scope of the invention. Although the reaction shown above depicts the formation of the condensation intermediate for the reaction between compound (XXIV) and an active methylene compound, it is understood that a similar intermediate is within the scope of the invention for compounds (XLV) and (XLII). Effective catalysts for the  
25 condensation may be selected from ammonia, primary, secondary and tertiary amines, either as the free base or the amine salt with an organic acid, such as acetic acid. Examples of catalysts include pyrrolidine, piperidine, pyridine, diethylamine and the acetate salts thereof. Inorganic catalysts may also be used for the condensation.

5 Inorganic catalysts include, but are not limited to, titanium tetrachloride and a tertiary base, such as pyridine; and magnesium oxide or zinc oxide in an inert solvent system. This type of condensation can be strongly solvent-dependent and it is understood that routine experimentation may be necessary to identify the optimal solvent with a particular catalyst, preferable solvents include ethanol, tetrahydrofuran, dioxane or  
10 toluene; or mixtures thereof.

The active methylene compound of the present invention may be 2,4-thiazolidinedione, 2-thioxo-4-thiazolidinone, 2,4-imidazolidinedione or 2-thioxo-4-imidazolidinedione. The resulting benzylidene (e.g., Figure 5, compound (XXXIII)) may be reduced, if desired, to a compound of Formula (I) wherein - - - - is absent  
15 (e.g., Figure 5, compound (XXX)).

In addition, various methods may be employed in the production of the compounds disclosed herein wherein  $n = 1$ , representative examples are shown in Figure 6. Structures of compound (XL) may be prepared by methods known in the art. The acid,  $R_{30} = H$  or the ester,  $R_{30} = \text{aryl, alkyl or substituted alkyl}$ , may be reduced to  
20 the corresponding benzyl alcohol (XLI) followed by oxidation to an aldehyde (XLII). Alternatively, ester (XL),  $R_{30} = \text{alkyl or substituted alkyl}$ , may be reduced directly to the aldehyde via selective reductions, for example, DIBAL. Aldehyde (XLII) may be reacted with a metal reagent, such as a Grignard reagent, to give benzyl alcohol (XLIV) that can subsequently be converted to ketone (XLV) via an oxidation, such as a Swern  
25 oxidation, Corey oxidation with NCS or another suitable procedure described by Hudlicky, M, *Oxidations in Organic Chemistry*, ACS Monograph 186 (1990), incorporated herein by reference. In a similar manner as described above, compound (XLII) or compound (XLV) may be condensed with an active methylene of a heterocycle to give compound (XLVI). The reduced analogue (XLVII) may be  
30 prepared in a manner similar to the process described above using a benzyl halide derived from either benzyl alcohol (XLI) or reduction from compound (XLVI).

5           In addition, various methods may be employed in the production of the compounds disclosed herein wherein n is either 0 or 1 and m is 0, representative examples are shown in Figure 7. Utilizing, for example, compound (XLII) or (XXIV) the carbonyl may be converted to a cyanohydrin using methods known in the art. Such methods include, the use of acetone cyanohydrin, TMS-CN/ZnI<sub>2</sub> (followed by  
10   hydrolysis of the TMS ether) and the like. The resulting alcohol of the cyanohydrin may be converted to a halide (where V = Cl or Br) with the use of thionyl chloride, thionyl bromide or the like, in the presence or absence of solvent. Conversion to compounds of Formula where m is equal to 0 may be prepared by the reaction of the (XLII b) or (XXIV b) with thiourea followed by hydrolysis.

#### Using the Compositions

The compounds of the present invention have been found to be potent compounds in a number of biological assays, both *in vitro* and *in vivo*, that correlate to, or are representative of, human diseases.

20           For instance, the compounds induce the differentiation of preadipocytes into adipocytes. This activity (Harris and Kletzien, *Mol. Pharmacol.*, 45:439-445 (1994); Willson et al., *J. Med. Chem.* 39:665-668 (1996)) has been observed for certain compounds that have antidiabetic activity in humans (Teboul et al., *J. Biol. Chem.* 270:28183-28187 (1995)). Examples for the adipocyte differentiation activity of the  
25   compounds of the present invention are shown in Figures 1a and 1b (rosiglitazone, Avandia<sup>TM</sup>, an insulin sensitizer approved for the treatment of type 2 diabetes, is shown for comparison). Figure 1a shows the differentiation activity of the present invention without the presence of insulin, whereas Figure 1b shows the differentiation activity in the presence of insulin. Both in the absence and presence of insulin, the disclosed  
30   compounds increase lipid levels. The ability of the compounds to induce cells of the adipocyte lineage to differentiate may also correlate to the ability of the compounds to

5     treat or prevent other diseases including such proliferative diseases as breast, prostate and other cancers.

          The ability of the compounds to function as antidiabetic molecules may be demonstrated in animal models for type 2 diabetes. In young *db/db* mice, compound 1 is shown to prevent increases in glucose and triglyceride levels when administered  
10     orally (Figures 2a, b). In another animal model of type 2 diabetes, the *ob/ob* mouse, compound 1 is shown to reduce glucose and triglyceride levels (Figures 3a, b). In yet another animal model of type 2 diabetes, diabetic *db/db* mice, compound 32 is shown to be equally or more potent than rosiglitazone in reducing glucose and triglyceride levels (Figure 4a and 4b).

15           Compounds disclosed herein are useful, for example, to modulate metabolism (such as, for example, lipid metabolism and carbohydrate metabolism) or adipocyte differentiation, and especially to treat type 2 diabetes. Modulation of lipid metabolism, for example, would include an increase of lipid content intracellularly or extracellularly. Modulation of lipid metabolism could also include a decrease of lipid  
20     content intracellularly or extracellularly. Modulation of metabolism may occur directly for example, through binding of the compound of Formula I with its cognate nuclear receptor, which directly affects an increase or decrease in lipid content by up-regulation or down-regulation of a gene involved in lipid metabolism. Modulation of metabolism may also occur indirectly, for example, through binding of the compound of Formula I  
25     with its cognate receptor, which up-regulates or down-regulates cellular differentiation or growth of cells that produce lipids, thereby indirectly causing lipid metabolism to be modulated. Modulation, for example, could be an increase in lipid metabolism, such that lipid metabolism is greater than that of a control. Modulation, also includes, for example, an increase in lipid metabolism, such that the lipid metabolism approaches  
30     that of a control. Likewise, modulation of lipid metabolism could be a decrease in lipid metabolism, such that the lipid metabolism is less than or decreasing towards a control. Carbohydrate metabolism may also be up-regulated or down-regulated to either

5 approach the level of carbohydrate metabolism in a control or to deviate from the level  
of carbohydrate metabolism in a control. Changes in carbohydrate metabolism may  
directly or indirectly also result in changes of lipid metabolism and, similarly, changes  
in lipid metabolism may lead to changes in carbohydrate metabolism. An example is  
type 2 diabetes where an increase in free fatty acids in the patients leads to decreased  
10 cellular uptake and metabolism of glucose.

Performing an adipocyte differentiation assay, as described in Examples 33 and  
34, is one way to assay whether a compound indirectly increases lipid content. In one  
disclosed embodiment, the compounds of Formula I, when the concentration of the  
compounds of Formula I is less than or equal to  $10^{-6}$  M, will lead to the differentiation  
15 of preadipocytes into adipocytes, of which the latter will have an increase in lipid  
content.

It is understood that a variety of lipid molecules may be modulated. The  
compounds disclosed herein may modulate a single type of lipid molecule, such as a  
triglyceride, or the compounds disclosed herein may modulate multiple types of lipid  
20 molecules. The compounds disclosed herein may also modulate a single or variety of  
carbohydrate molecules. The compounds disclosed herein may modulate metabolism  
disorders, such as type 2 diabetes. Metabolism can be modulated by the compounds  
disclosed herein by, for example, decreasing the serum glucose levels and/or decreasing  
the serum triglyceride levels, relative to a control having serum glucose and/or  
25 triglyceride levels indicative of a mammal having type 2 diabetes. It is recognized that  
any decrease in serum glucose and/or triglyceride levels can benefit the mammal  
having type 2 diabetes.

These compounds may be characterized by their low molecular weights and  
physiological stability, and therefore, represent a class that may be implemented to  
30 prevent, alleviate, and/or otherwise, treat disorders of lipid and carbohydrate  
metabolism, such as obesity, dislipidemia, type 2 diabetes and other diseases related to  
type 2 diabetes. It is understood that treatment or prevention of type 2 diabetes may

- 5 involve modulation of lipid or carbohydrate metabolism, such as the modulation of serum glucose or serum triglyceride levels.

5 comprising one or more compounds and/or a pharmaceutically acceptable salt thereof, together with one or more pharmaceutically acceptable carriers thereof and, optionally, other therapeutic and/or prophylactic ingredients. The carrier(s) must be 'acceptable' in the sense of being compatible with the other ingredients of the composition and not overly deleterious to the recipient thereof.

10 Pharmaceutical compositions include those suitable for oral, enteral, parental (including intramuscular, subcutaneous and intravenous), topical, nasal, vaginal, ophthalmic, sublingually or by inhalation administration. The compositions may, where appropriate, be conveniently presented in discrete unit dosage forms and may be prepared by any of the methods well known in the art of pharmacy. Such methods  
15 include the step of bringing into association the active compound with liquid carriers, solid matrices, semi-solid carriers, finely divided solid carriers or combination thereof, and then, if necessary, shaping the product into the desired delivery system.

Pharmaceutical compositions suitable for oral administration may be presented as discrete unit dosage forms such as hard or soft gelatin capsules, cachets or tablets  
20 each containing a predetermined amount of the active ingredient; as a powder or as granules; as a solution, a suspension or as an emulsion. Tablets and capsules for oral administration may contain conventional excipients such as binding agents, fillers, lubricants, disintegrants, or wetting agents. The tablets may be coated according to methods well  
25 known in the art., e.g., with enteric coatings.

Alternatively, the active ingredient may be in powder form, obtained by aseptic isolation of sterile solid or by lyophilization from solution, for constitution with a suitable vehicle, e.g., sterile, pyrogen-free water, before use.

          For topical administration to the epidermis, the compounds may be formulated  
15 as ointments, creams or lotions, or as the active ingredient of a transdermal patch. Suitable transdermal delivery systems are disclosed, for example, in Fisher et al. (U.S. Patent (No. 4,788,603, incorporated herein by reference) or Bawas et al. (U.S. Patent No. 4,931,279, 4,668,504 and 4,713,224; all incorporated herein by reference). Ointments and creams may, for example, be formulated with an aqueous or oily base  
20 with the addition of suitable thickening and/or gelling agents. Lotions may be formulated with an aqueous or oily base and will in general also contain one or more emulsifying agents, stabilizing agents, dispersing agents, suspending agents, thickening agents, or coloring agents. The active ingredient may also be delivered via iontophoresis, e.g., as disclosed in U.S. Patent Nos. 4,140,122, 4,383,529, or 4,051,842;  
25 incorporated herein by reference.

          When desired, the above-described compositions may be adapted to provide sustained release of the active ingredient employed, e.g., by combination thereof with

- 5 certain hydrophilic polymer matrices, e.g., comprising natural gels, synthetic polymer gels or mixtures thereof.

The pharmaceutical compositions according to the invention may also contain other adjuvants such as flavorings, coloring, antimicrobial agents, or preservatives.

- 10 It will be further appreciated that the amount of the compound, or an active salt or derivative thereof, required for use in treatment will vary not only with the particular salt selected but also with the route of administration, the nature of the condition being treated and the age and condition of the patient and will be ultimately at the discretion of the attendant physician or clinician.

- 15 In general, one of skill in the art understands how to extrapolate *in vivo* data obtained in a model organism, such as an ob/ob or db/db mouse, to another mammal, such as a human. These extrapolations are not simply based on the weights of the two organisms, but rather incorporate differences in metabolism, differences in pharmacological delivery, and administrative routes. Based on these types of considerations, a suitable dose will, in alternative embodiments, typically be in the range of from about 0.5 to about 100 mg/kg/day, from about 1 to about 75 mg/kg of body weight per day, from about 3 to about 50 mg per kilogram body weight of the recipient per day, or in the range of 6 to 90 mg/kg/day, most preferably in the range of 15 to 60 mg/kg/day.

- 25 The compound is conveniently administered in unit dosage form; for example, in alternative embodiments, containing 0.5 to 1000 mg, 5 to 750 mg, most conveniently, or 10 to 500 mg of active ingredient per unit dosage form.

One skilled in the art will recognize that dosage and dosage forms outside these typical ranges can be tested and, where appropriate, be used in the methods of this invention.

- 30 In separate embodiments, the active ingredient may be administered to achieve peak plasma concentrations of the active compound of from about 0.5 to about 75  $\mu$ M,

5 about 1 to 50  $\mu$ M, or about 2 to about 30  $\mu$ M. This may be achieved, for example, by the intravenous injection of a 0.05 to 5% solution of the active ingredient, optionally in saline, or orally administered as a bolus containing about 0.5-500 mg of the active ingredient. Desirable blood levels may be maintained by continuous infusion to provide about 0.01-5.0 mg/kg/hr or by intermittent infusions containing about 0.4-15  
10 mg/kg of the active ingredients.

The desired dose may conveniently be presented in a single dose or as divided doses administered at appropriate intervals, for example, as two, three, four or more sub-doses per day. The sub-dose itself may be further divided, e.g., into a number of discrete loosely spaced administrations; such as multiple inhalations from an insufflator  
15 or by application of a plurality of drops into the eye.

While the invention has been described in connection with specific embodiments thereof, it will be understood that it is capable of further modifications and this application is intended to cover any variations, uses, or adaptations of the invention following, in general, the principles of the invention and including such  
20 departures from the present disclosure as come within known or customary practice within the art to which the invention pertains and as may be applied to the essential features hereinbefore set forth, and as follows in the scope of the appended claims.

The following examples are given to illustrate the invention and are not intended to be inclusive in any manner:

**Example 35: Oral Administration of Compound 1 in the Early Intervention Treatment of Type 2 Diabetes in *db/db* Mutant Mice**

30

**Methods****Animals and Housing**

5           Five week-old female *db/db* mutant mice (C57BL/KsJ-*db*  $+/+$  m; Jackson Labs) were housed in a fixed 12-12- hr artificial light-dark cycle, and maintained on a standard high fat diet (containing at least 11% crude fat) provided ad libitum (Teklad S-2335). Animals were allowed two days to acclimate in this experimental environment prior to the initiation of the study.

10

**Dosage Groups and Treatment**

Prior to initiation of treatment, the animals were bled from the tail vein (100-200 $\mu$ L of whole blood) and serum levels of glucose and triglycerides were measured in duplicate (Trinder kits; Sigma, St.Louis, MO). Based on these initial measures, 15 animals (not yet hyperglycemic) were sorted into groups with approximately the same average serum glucose levels. Once sorted, the animals were housed six per cage and provided high fat rodent diet *ad libitum*.

**Experiment I: (Compound 1)**

20           Treatment groups( $n=6$ /group):

- 1) *db/db* control (sesame oil)
- 2) Compound 1 (0.3mg/kg; twice daily)
- 3) Compound 1 (1mg/kg; twice daily)

**Experiment II: (Compound 32)**

25           Treatment groups( $n=6$ /group):

- 1) *db/db* control (sesame oil)
- 2) Compound 32 (0.3mg/kg; once daily)
- 3) Compound 32 (1mg/kg; once daily)
- 4) Compound 32 (3mg/kg; once daily)
- 30           3) Rosiglitazone (1mg/kg; only daily)

5 Drug is prepared by mixing Compound 1 or 32 in sesame oil, and administered to animals in a volume of 5ml/kg/dose. Drug is administered by oral gavage daily at the beginning (Compound 1 and 32) and end of the artificial dark cycle (Compound 1; 12 hour interval).

10 **Serum Measurements**

To monitor the effect of Compound 1 or 32, animals were bled following a three-hour fast at the end of the dark cycle on days 12 of the treatment period. Fasting serum glucose and triglyceride levels were measured in duplicate. The blood is kept at room temperature to allow coagulation, after which the serum is separated and assayed for  
15 glucose and triglyceride levels. As shown in Figures 2A, 2B, 4A and 4B, Compound 1 and 32 prevented the onset of diabetes in both treatment groups with doses as low as 0.3 mg/kg when administered once (Compound 32) or twice (Compound 1) a day. Both serum glucose and triglyceride levels remained well within the normal range compared to control animals, which showed the typical hyperglycemia and  
20 hypertriglyceridemia associated with the onset of type 2 diabetes.

30 environment prior to the initiation of the study.

**Dosage Groups and Treatment**

5 Prior to initiation of treatment, the animals were bled from the tail vein (100-  
200 $\mu$ L of whole blood) and serum levels of glucose and triglycerides were measured in  
duplicate (Trinder kits; Sigma, St.Louis, MO). Based on these initial measures,  
hyperglycemic animals were sorted into groups with approximately the same average  
serum glucose levels. Once sorted, the animals were housed six per cage and provided  
10 standard rodent diet *ad libitum*.

Treatment groups( $n=6/group$ ):

1) *ob/ob* control (sesame oil)

2) Compound 1 (5mg/kg twice daily)

Drug is prepared by mixing Compound 1 in sesame oil, and administered to  
15 animals in a volume of 3ml/kg/dose. Drug is administered by oral gavage twice daily at  
the beginning and end of the artificial dark cycle (12 hour interval).

#### **Serum Measurements**

To monitor the effect of Compound 1, animals were bled following a three-hour  
20 fast at the end of the dark cycle on days 7 and 14 of the treatment period. Fasting  
serum glucose and triglyceride levels were measured in duplicate. The blood is kept at  
room temperature to allow coagulation, after which the serum is separated and assayed  
for glucose and triglyceride levels. As shown in Figures 3A and 3B, Compound 1  
produced a significant decrease in serum glucose levels following 1 and 2 weeks of  
25 treatment ( $p<0.05$ ; ANOVA and Fisher's Least Significant Difference; Figure 3A).  
Similarly, treatment with Compound 1 for two weeks significantly reduced triglyceride  
levels compared to control ( $p<0.05$ , Figure 3B).

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-5, 9, 10, 19, 24-27, 29, 31-53 (all partly)

Present claims 1-5, 9, 10, 19, 24-27, 29 and 31-53 relate to an extremely large number of possible compounds, their use and preparation. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds and uses claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds of formula (I) according to claim 1, wherein m is 1 and W, X, Y and Z are as defined in claim 6, i.e. all examples and specifically recited compounds of the application.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.
